MOBILE PHONE HOLDER EXERCISE 2.

Prerequisite Knowledge	Previous knowledge of the following commands is required to complete this lesson; **Sketch** (Line, Centerline, Circle, Add Relations, Smart Dimension), **Sheet Metal tools** and **Edit Materials.**
Focus of lesson	A 3D model of a mobile phone holder as a sheet metal part and then may be unfolded to create additional features. With the **Unfold** and **Fold** tools, you can flatten and bend one, more than one, or all of the bends in a sheet metal part. This combination is useful when adding a cut across a bend.
Commands Used	This lesson includes Sketching, Base Flange, Flatten, Extruded Cut, Fold and Unfold.
New File	Create a new part file.
Save File	Save the file as '**Mobile Phone Holder'** to a folder called **'Phone holder'** (Continue to save periodically throughout the exercise)

Getting Started   Activate Sketch and Sheet Metal tabs on the
command manager as outlined in earlier exercises
Creating a sketch   How do we start to model the mobile phone holder
as a sheet metal part?

We will first create a open contour sketch based on
a profile of the artefact
Choosing a plane   Choose the **Right plane** from the Design Tree and select
the sketch icon from the pop up toolbar

Creating a sketch   Select the **Line** command and create a sketch of the profile
of the mobile phone holder with one point located
on the origin as indicated.

Origin
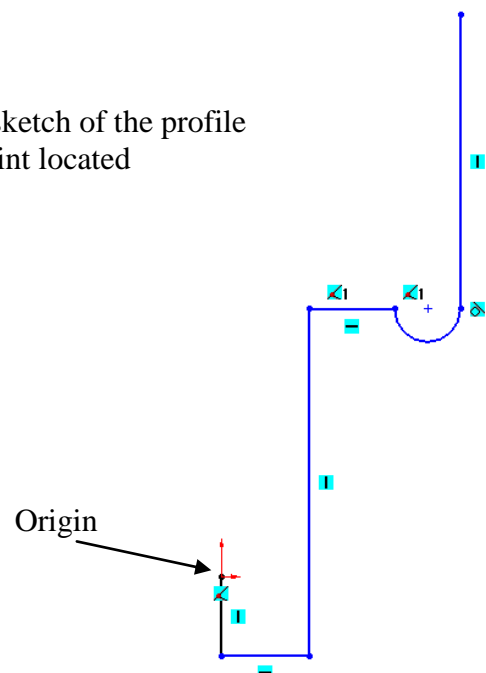

As we are using the Right plane we are creating sketch of the
end view of the model.

Adding relations

Select the three points indicated relating
to the arc and apply a 'Horizontal' relation
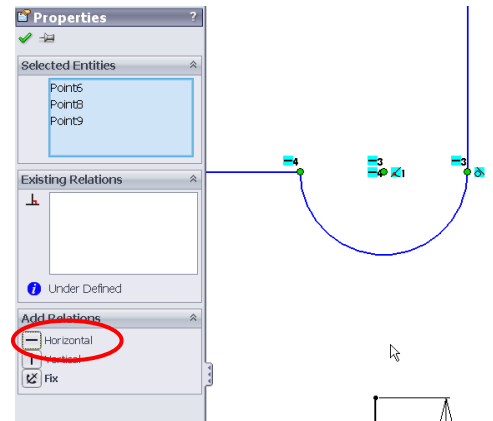

Smart Dimension

Dimension the sketch as shown opposite

Always start with the smaller dimensions

Exit the sketch when fully defined

**Creating the Sheet
Metal Feature**

Select Base Flange from the
Sheet Metal toolbar

Select the sketch

Choose 'Mid Plane' as the end
condition for Direction 1
Insert 60mm as the width

Apply a thickness of 3mm

Apply a bend radius of 1mm

Select Ok ✔

You will notice that three items are added to the design Tree:

- Sheet-Metal1 containing the properties of the part
- Base-Flange1 which is the feature just created
- Flat-Pattern1 which is suppressed

Rename Base Flange1

Rename this feature as '**Phone Holder**'

Chamfer Corners

Select 'Break-Corner/Corner Trim from the Sheet Metal toolbar

Select the appropriate Corners – Edge<1> and Edge<2>

Choose 'Chamfer' as the Break type
Apply a distance of 10mm

Select Ok

Rename feature   Rename this feature as 10mm chamfer
Sketching the Plug Holes

Right click the face as indicated. The chosen face will highlight in green as shown. Select the sketch icon from the heads up toolbar

Select 'Normal to'

Normal To (Ctrl+8)
Rotates and zooms the model to

**Creating the
Sketch**

From the sketch toolbar select Centreline
from the drop down menu of the line command.

Next move the cursor over the top edge.
The centre of the edge will automatically
be highlighted as shown. Left click on the
point and draw a vertical line down the entire
face as shown.

Next create a rough sketch of the plug holes
using the 'Line' and 'Rectangle' commands
as shown on one side of the centreline.
Smart Dimension as shown.

**Mirror the
Entities**

Select 'Mirror Entities' from the sketch toolbar.

Select the lines to mirror. Mirror about the centreline of the face.

Exit the sketch.

|	
Extruded Cut	Select Extruded Cut from the sheet metal toolbar.
	Select the previous sketch created
	Choose 'Through All' as the end condition of 'Direction 1'
	Select Ok
Rename feature	Rename feature as 'Plug holes'.
Edit Material	Right click on 'Materials <not specified> in the Design Tree and select 'Edit Material'
	Scroll down to the 'Plastics' folder and select 'Acrylic (Medium-high impact' and choose 'Apply' and 'Close'
Apply Colour	Right click on any face of the mobile phone holder
	Select the Appearance icon and select the 'Mobile Phone Holder' part
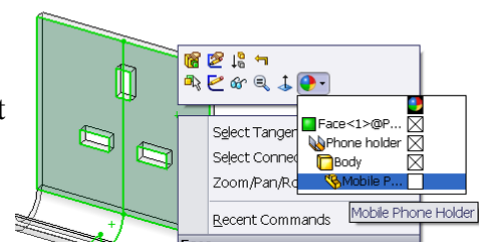

Select a colour from the swatch in the Appearances Property Manager

Select Ok
Unfold/Fold **Unfold** can be used to flatten a model, allowing you to create sheet metal features which cross bend lines eg a hole or slot. **Fold** takes the unfolded model in the flattened state and refolds it.

Any feature created in the unfolded state will appear above the flat-pattern feature in the featuremanager design tree and hence will appear when the flat-pattern feature is suppressed.

Unfold Select Unfold from the sheet metal toolbar *or* choose **Insert, Sheet metal, Unfold…**
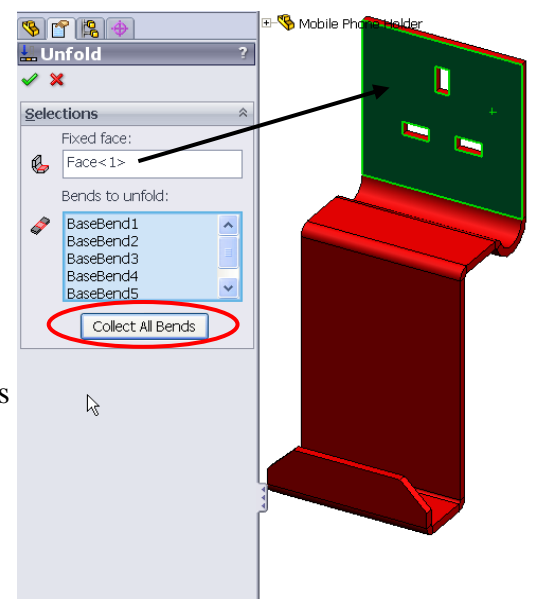

Choose the following options;

Fixed face: This will be the only surface which remains stationary. Choose the face as shown.

Bends to Unfold: These may be selected individually from the graphics area or choose all bends.
In this case we wish to unfold all the bends so we select **Collect All Bends.**

SolidWorks will automatically select all bends from the model.

Choose **OK**

The model is now unfolded. Notice
how similar unfolding is to flattening.
However, unfolding allows us to add
sheet metal features and include them
in the flat-pattern feature. Flattening
does not allow us to do this.

**Create a slotted
feature**

A number of slot types can be created depending on the requirements

- Straight Slot - sketch a straight slot using the two end points
- Centerpoint Straight Slot - sketch a straight slot from the center point
- 3 Point Arc Slot - sketch an arc slot using three points along the arc
- Centerpoint Arc Slot - sketch an arc slot using the center point of the arc
 and the two end points.

In this case we will create a straight slot

Right click on the face of the unfolded model
and select the sketch icon.

Select 'Straight Slot' from the sketch toolbar.
Start the sketch by clicking vertically below the origin
to specify the starting point of the slot

Move the cursor and then click to specify the
approximate length of the slot

Move the cursor and then click to specify the
width of the slot.
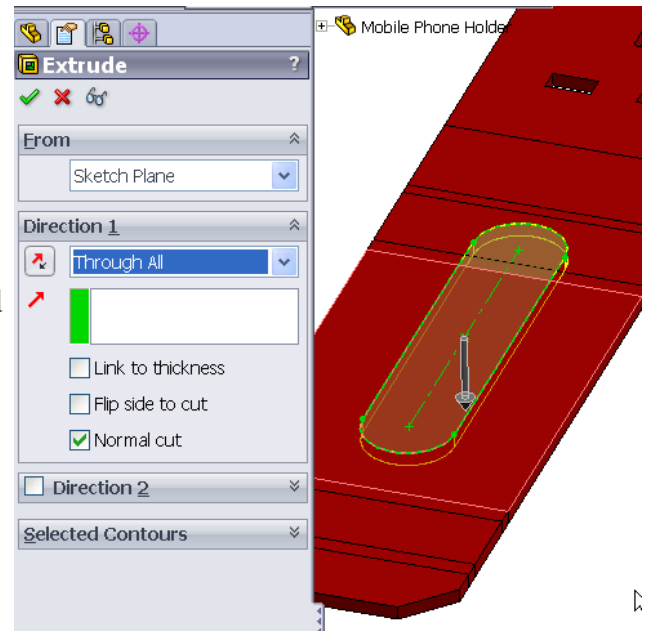

Smart dimension as shown

Extruded Cut Select Extruded Cut from the Sheet metal toolbar

Select the sketch of the slot

Choose 'Through All' as the end condition of the feature

Choose Ok

**Rename feature** Rename extruded cut feature as 'Slot'

Shaping We will now shape the material across a number of the faces of the folder while it is in the unfolded position.
**Sketch** Right click on the front face of the unfolded holder and select the sketch icon

Choose 'Normal to' from the heads-up toolbar

Normal To   (Ctrl+8)
Rotates and zooms the model to

Using the line command, start the sketch on the
midpoint of what will be the horizontal surface
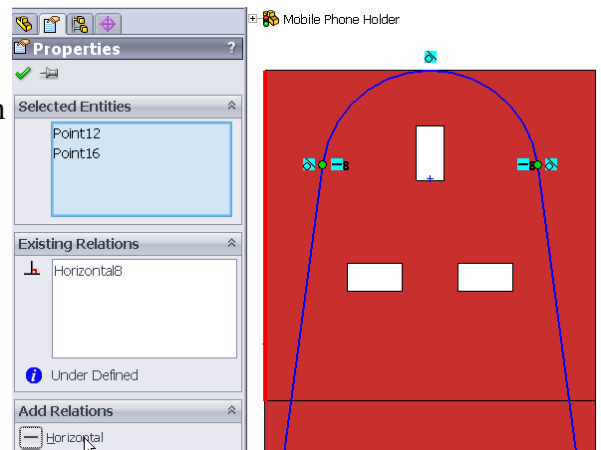

Create the sketch as shown

Add a 'Tangent' relation between
the line and the arc

Add a 'Tangent' relation between
the arc and the top edge of the
material

Add a 'Horizontal' relation between the two points of contact between the lines and the arc

Smart dimension the radius of the arc – 20mm

The sketch is now fully defined.

Exit the sketch

Extruded Cut   Select Extruded Cut from the Sheet metal toolbar
Select the sketch for the shaping

Choose Ok ✔

Rename feature   Rename extruded cut feature as 'Shaping'

Fold   Now that the slot and shaping has been added to the mobile phone holder we can refold the object. Select **Fold** 🔧 Fold   from the sheet metal toolbar
or
Choose **Insert, Sheet metal, Fold** from the drop-down menu

Folding the holder follows a similar procedure to unfold it.

Fixed Face

By default SolidWorks chooses the same **fixed face** as was used to unfold the model. A different face may be chosen if you wish

Bends to fold

Choose **Collect All Bends**

The model will fold along the bend lines and the folded model will include the cut-out.

Image Quality

You can improve the image quality by going to Tools/Option/Document Properties/ Image Quality and move the slider to the right as in previous exercises
Flatten the model

Right click on the Flat-pattern feature and choose **Unsuppress**   Flat-Pattern1

or

Choose 'Flatten'   Flatten   from the sheet metal toolbar.

Note: This tool will both flatten and unflatten the model

UP 158.68° R 7

DOWN 68.68° R 1

DOWN 90.00° R 1

UP 90.00° R 1

UP 90.00° R 1
